

PROJECT PROFILE

Stevens Institute of Technology
Hoboken, New Jersey

When Stevens Institute of Technology was founded in 1870, the original building plans called for a large steeple atop the central masonry tower.

The steeple was never built, and when the building was renovated on the school's 125th anniversary, the decision was made to add the steeple.

The architectural firm of Nadasky - Kopelson of Morriston, NJ, chose fiberglass because of its strength, durability, and ability to duplicate the appearance of the original slate, copper, and sandstone used elsewhere on the building.

Fiberglass Specialties fabricated the 22' wide, 40' tall steeple at their factory and assembled it on site, where the contractor easily hoisted and installed it in less than 5 hours.

"Manufacturers of Quality Architectural Fiberglass Products"
